Optical fibers have been used in telecommunication systems for many years. During this time, a number of different configurations have been used to provide a physical link between a signal source and a signal destination. These optical fibers are typically provided within a protective, rigid enclosure or housing. In some applications, the optical fiber is coupled to an optical fiber connector at one end of the housing and a mating optical fiber connector is coupled to another end of the housing. In other applications, the optical fiber is coupled to a light source and/or a light detector at one end of the housing and the optical fiber couples to a light source and/or a light detector at the other end of the housing. In some applications, the optical fiber is coupled to a variety of different optical devices that may be used to test for different environmental conditions, such as temperature, pressure, humidity, or the like, in which the optical fiber resides. In these applications, the optical fiber is coupled to the optical device within the housing so that the environmental conditions can be tested by passing light through the optical fiber and measuring the optical power 82157476af
